

Analyst study: Revenues from warehouse robotics to top \$51 billion by 2030

ABI Research finds that evolving ecommerce fulfillment operations and improvements in robotics tech and AI are rapidly growing the commercial robotics market

By MMH Staff · August 19, 2021

Worldwide commercial robot revenue in warehouses will have a Compounded Annual Growth Rate (CAGR) of over 23% from 2021 to 2030 and exceed US \$51 billion by 2030, according to a new report by ABI Research (<https://www.abiresearch.com/>), a global tech market advisory firm.

The warehousing industry has ramped up its automation efforts considering the increased order volume and labor shortages fueled by the pandemic, ABI explained in its announcement. In addition to technology solutions such as Augmented Reality (AR) powered smart glasses and handheld devices with enhanced capabilities, autonomous, collaborative, and mobile robots are proving to be the most popular and fastest growing productivity enhancing solution in the warehouse workspace

“Mobile robots are at the heart of the warehouse robotics market and account for most shipments and revenue. These robots, made up of Autonomous Guided Vehicles (AGVs) (</topic/tag/AGVs>) and Autonomous Mobile Robots (AMRs), are being used to move goods within the warehouse and being integrated within wider automated or manual workflows,” states Adhish Luitel, Industry Analyst, Supply Chain Management and Logistics at ABI Research.

Commercially speaking in the warehouse sector, robotics has moved from the early exploration phase to a more mature market in which early adopters are benefitting from live implementations of fully capable technical solutions. As a sign of the growing maturity of the market, a wide number of vendors such as Advantech, Brochesia, Kontakt.io, and RightHand Robotics now offer compelling products and solutions. The surrounding ecosystem of software vendors and systems integrators is also maturing, as software and integration capabilities become increasingly important factors for commercial differentiation. ABI Research has assessed fulfillment and warehousing processes of dominant operators such as Penske, A. Duie Pyle, Amazon, and JD.com to evaluate the efficacy of deploying solutions and friction points that might arise. These companies have been reaping the benefits of enhanced key performance metrics such as shorter dock-to-stock cycles and improved inventory accuracy thanks to successful deployment of various automation and vision-based solutions in their day-to-day operations.

“In addition to robots, warehouse operators should be seeking to combine the value of multiple solutions across the fulfillment workflow to achieve desired results. There is also a need for operators to look beyond productivity and assess how technologies affect worker satisfaction and safety, worker comfort, energy consumption, distance traveled, and error rates,” Luitel explains.

For example, “Pick-by-vision” solutions from augmented reality vendors such as Picavi demand a mere 15-minute training time and can boast up to 30% efficiency gains and up to 60% in time savings for training. In addition, order storage and automated order dispenser solutions from Alert Innovation helps grocery retailers enhance their Return on Investment (ROI) by over 50% versus traditional automated picking systems.

“We can also expect intelligent automation solutions to influence processes across the supply chain. In the future, operators will be venturing further into solutions like Robotic Process Automation (RPA) and mobile warehousing,” Luitel concludes.

These findings are from ABI Research’s Modern Fulfillment Trends: Warehouse Robotics, Handheld Devices and Wearables technology (<https://www.abiresearch.com/market-research/product/7779514-modern-fulfillment-trends-warehouse-roboti/>) analysis report. This report is part of the company’s Supply Chain Management & Logistics research service, which includes research, data, and ABI Insights.
